

Test Credit Card Numbers

The iVeri Gateway provides a mechanism where a merchant can perform test transactions that are routed to an iVeri Gateway issuer simulator. This enables a merchant to complete testing within a test environment. When the merchant is ready s/he can perform live transactions which are routed to the genuine card issuer.

A merchant specifies the mode of a transaction by setting Mode as "Test" or "Live", and sends their corresponding Test or Live ApplicationID.

Sending the following credit card numbers to the Test environment has the following results:

| Credit Card Number | Result |
|---|--|
| 4242424242424242 | returns "Authorised" |
| 2121212121212121 | randomly returns "Hot Card", "Please Call" or "Denied" |
| 5454545454545454 | randomly returns "Unable to process" or times out |
| All other card numbers (eg "1111222233334444") | returns "Invalid card number" |

NOTES:

1. The Expiry Date of the above test card numbers should be any date in the future. However, please do not use a date more than 2 years in the future.
2. Card Security Code (CVV) Field – you can use any three numbers for testing purposes.
3. If you want to generate the error "Invalid Expiry Date", make the expiry date in the past.
4. Iveri Batch merchants must use the following test USN number in the header record: 2161342983
5. Merchants are requested not to abuse the test environment more than their realistic requirements.
